Experiment 6

Calculate Total Purchase Cost

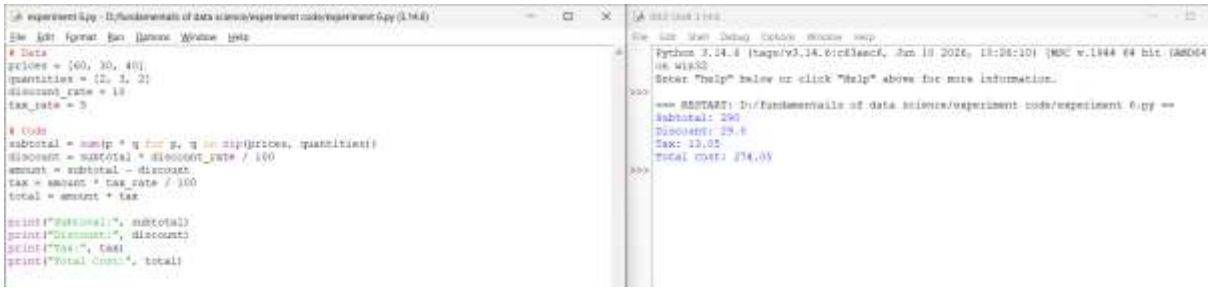

Aim:

To write a Python program using arithmetic operations to calculate the total cost of a customer's purchase, including discounts and taxes.

Procedure:

1. Initialize lists containing item prices and quantities.
2. Assign the discount rate and tax rate as percentages.
3. Calculate the subtotal by multiplying each item's price by its quantity and adding the amounts.
4. Calculate the discount and subtract it from the subtotal.
5. Calculate the tax on the discounted amount.
6. Add the tax to obtain the final purchase cost.
7. Display the subtotal, discount, tax, and total cost.

Output:

Result:

The total purchase cost was calculated successfully using arithmetic operations after applying the discount and tax.
