Experiment 8

Find the Top 5 Best-Selling Products

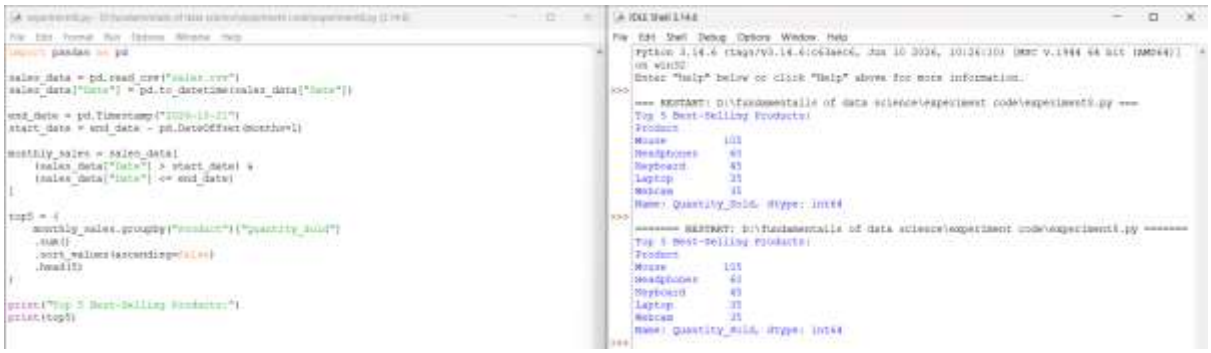

Aim:

To write a Python program using Pandas to identify the top five best-selling products based on their total quantities sold during the past month.

Procedure:

1. Import the Pandas library.
2. Create a dataset containing sales dates, product names, and quantities sold.
3. Convert the date column into datetime format.
4. Filter the records to include only sales from the required one-month period.
5. Group the data by product name.
6. Calculate the total quantity sold for each product using sum().
7. Sort the products in descending order using sort_values().
8. Use head(5) to display the top five best-selling products.

Output:

Result:

The top five best-selling products were successfully identified by filtering monthly sales data, calculating total quantities, and sorting the products in descending order.
